Clinical Policy Title: Cryopreservation of sperm and embryos

Clinical Policy Number: 12.03.05

Effective Date: October 1, 2015
Initial Review Date: June 17, 2015
Most Recent Review Date: July 15, 2015
Next Review Date: May 2016

Related policies: None.

Coverage policy

Arbor Health Plan considers cryopreservation of sperm and embryos in preserving fertility in post-pubertal men or women facing infertility due to chemotherapy or other gonadotoxic therapies to be clinically proven and, therefore, medically necessary.

Limitations:

Arbor Health Plan considers cryopreservation of sperm and embryos for purposes of circumventing the reproductive aging process not to be medically necessary and, therefore, not covered.

Infertility services are always subject to legislative mandate. Some states mandate benefit coverage for certain infertility services, including cryopreservation. Where legislative mandates exist, they supersede benefit plan design.

NOTE: The following CPT codes are not included in the Medicaid fee schedule for Nebraska:
89258 - Cryopreservation; embryo(s)

89259 - Cryopreservation; sperm

89335 - Cryopreservation; reproductive tissue, testicular

**Alternative covered services:**

- Reproductive endocrinology to maximize the reproductive potential of cancer patients and survivors.
- Ovarian transposition to physically move the ovaries out of the pelvis through surgical techniques in cases where pelvic radiation is required, to minimize the damaging effects of ionizing radiation on the ovaries.
- Gonadotropin agonist injections to chemically regulate the ovaries or testes.

**Background**

Therapies to treat medical conditions, such as cancer, may compromise fertility. *Chemotherapy* agents linked to fertility issues include:

- Cisplatin.
- Cyclophosphamide.
- Chlorambucil.
- Busulfan.
- Procarbazine.
- Carmustine.
- Iomustine.
- Mechlorethamine.
- Melphalan.

*Radiation therapy* may have potential side effects that affect fertility issues:

- In females, reproductive organs may suffer damage by direct irradiation or scattered radiation even after shielding.
- In males, the spermatogonia are extremely sensitive to radiation regardless of age.
Radical surgical procedures for cancer may have adverse effects upon reproductive capacity and fertility:

- Oncologic surgery for uterine, ovarian, bladder or colon cancer in females.
- Oncologic surgery for prostate, bladder or colon cancer in men.

Long-term treatment of estrogen-receptor positive breast cancer also has side effects that influence fertility decisions.

Options to preserve fertility include cryopreservation of sperm and embryos. Cryopreservation is the process of cooling and storing cells, tissues or organs at very low or freezing temperatures to save them for future use. It is used to preserve sperm, semen, oocytes (eggs), embryos, ovarian tissue or testicular tissue as an option for post-pubertal men and women who wish to or must delay reproduction for various reasons, including the need to undergo therapies that threaten their reproductive health, such as cancer treatment.

Currently, there are no fertility preservation options available for the pre-pubertal male or female.

Searches

Arbor Health Plan searched PubMed and the databases of:

- Agency for Healthcare Research and Quality’s National Guideline Clearinghouse and other evidence-based practice centers.
- The Centers for Medicare & Medicaid Services (CMS).

Searches were conducted on June 1, 2015, using the terms "embryo," "egg," "preservation," "freezing," "banking," "oocyte," "sperm" and "cryopreservation."

We included:

- Systematic reviews, which pool results from multiple studies to achieve larger sample sizes and greater precision of effect estimation than in smaller primary studies. Systematic reviews use predetermined transparent methods to minimize bias, effectively treating the review as a scientific endeavor, and are thus rated highest in evidence-grading hierarchies.
- Guidelines based on systematic reviews.
- Randomized controlled trials which are clinical trials of a therapeutic agent's efficacy, in which patients are randomly assigned to different treatment, placebo, or "gold standard" arms of a study.
• Economic analyses, such as cost-effectiveness, and benefit or utility studies (but not simple cost studies), reporting both costs and outcomes — sometimes referred to as efficiency studies — which also rank near the top of evidence hierarchies.

Findings

• A contemporary narrative review (Rodriguez-Wahlberg, 2014) addressed specifically and in depth the threat to fertility from cancer treatment and concluded, "In adult patients, cryopreservation techniques, such as sperm banking for males and embryo and oocyte banking for females, both of which are now established methods, may also be considered prior to (treatment)"

• The National Comprehensive Cancer Network Clinical Practice Guidelines for Adolescent and Young Adult Oncology (NCCN, 2014) include oophoropexy for females receiving radiation therapy. For individuals where treatment can be delayed long enough for a cycle of oocyte stimulation, then embryo cryopreservation should be discussed.

• The Practice Committees of the American Society for Reproductive Medicine (ASRM, 2013) published a committee opinion on fertility preservation for individuals undergoing gonadotoxic therapy or gonadectomy, which includes embryo cryopreservation as an "established modality for fertility preservation."

• The American Society of Clinical Oncology (Loren, 2013) conducted a systematic review of the evidence on fertility preservation for adults and children with cancer. Sperm, embryo and oocyte cryopreservation are considered standard practice.

• The American Cancer Society (ACS, 2013) considers sperm banking an effective way for men who have gone through puberty to store sperm for future use. In general, sperm collected before cancer treatment is just as likely to start a pregnancy as sperm from men without cancer. Sperm banking has resulted in thousands of pregnancies, without unusual rates of birth defects or health problems in the children. Once sperm is stored, it remains good for many years.

• The National Institute for Health and Care Excellence (NICE, 2013) addresses cryopreservation issues in adults and adolescents:
  
  o When using cryopreservation to preserve fertility in people diagnosed with cancer, use sperm, embryos or oocytes.
o Offer sperm cryopreservation to men and adolescent boys who are preparing for medical cancer treatment likely to make them infertile.

o Offer oocyte or embryo cryopreservation as appropriate to women of reproductive age (including adolescent girls) preparing for medical cancer treatment likely to make them infertile if:
  o They are well enough to undergo ovarian stimulation and egg collection.
  o This will not worsen their condition.
  o Enough time is available before the start of their cancer treatment.

A narrative review (Dillon, 2012) concluded that, with improved survival rates for childhood cancers, long-term implications with regard to fertility were gaining importance. However, there are at present no fertility preservation measures available to pre-pubertal boys and only experimental ovarian tissue cryopreservation available to pre-pubertal girls.

Laws governing disputes about cryopreserved embryos vary by state. Some states (e.g., Tennessee) take a balance-of-interests approach. A 1992 decision argued that, in the absence of a prior agreement about the disposition of pre-embryos, the party wishing to avoid procreation should prevail if the other party had a reasonable alternative option for becoming a parent. The court ordered that the pre-embryos of a divorcing couple should be discarded, finding in favor of the former husband, who did not wish to become a father.

In the wake of this precedent-setting case, many states, such as New York and Texas, began to opt for contractual enforcement. In a 1998 dispute between a divorcing couple, the Court of Appeals in Albany, NY, followed the contract that the couple had signed with the clinic.

In another approach, Iowa requires mutual consent before embryos can be disposed of or used. Massachusetts will not enforce contracts in such cases. After a 2000 divorce dispute, the Massachusetts Supreme Court ruled, “As a matter of public policy, we conclude that forced procreation is not an area amenable to judicial enforcement.”

In the most recent court decision in the Szafranski-Dunston case in May 2014, Judge Sophia Hall argued that the decision should be based on a contract; but, if there is no contract, a balance of interests should be used. Hall argued that a phone conversation between Dunston and Szafranski was an oral contract. She further noted that the case was likely to be appealed, and that, were it to be considered on a balance of interests, Dunston’s (the mother) should prevail because she could not have a genetically related child by any other means: “The Court … finds that Karla’s desire to have a biological child in the face of the impossibility of having one without using the embryos, outweighs Jacob’s privacy concerns,” Hall wrote.

Costs for maintaining cryopreserved samples of sperm or embryo are modest. Query produced three examples for comparison purposes:
At Fairfax, VA, Cryobank (a national chain at various locations: Austin, Houston, Philadelphia and Roseville, MN) the following fee schedule for storage and release of semen specimens prevails:

- Fees are by account regardless of the number of vials stored.
- Semen specimens/patient - monthly $40.
- Semen specimens/patient — Prepaid one year $395.
- Semen specimens/patient — Prepaid two years $670.
- Semen specimens/patient — Prepaid three years $985.
- Semen specimens/patient — Prepaid five years $1,340.
- Semen specimens/patient — Prepaid 10 years $2,400.
- Semen specimen release (handling) $45.

At ReproTech Ltd. (a national chain at various locations: Texas, Minnesota, Florida and Nevada) the following fee schedule prevails:

**Sperm, oocytes (eggs) or ovarian tissue:**

<table>

There is a surcharge for "potentially infectious" specimen handling at ReproTech Ltd.

Neither company bills for its services directly by mail or electronic means to insurers. Both offer the client a receipt that can be submitted to the client's insurer for reimbursement.

Specialists in Reproductive Medicine & Surgery, P.A., of Ft Myers, FL, maintain this fee schedule (subject to change without notice):

Cryopreservation, transportation and storage fees:
Probable oocyte cryopreservation fees: $1,400.00
**Oocyte storage fee — first year (paid directly to RTL-long term storage facility): $275.00
Federal Express send to RTL (paid to RTL): $215.00
Subtotal: $1,890.00
** These fees are paid directly to RTL long-term storage facility. Your credit card information will be obtained for RTL on or before baseline.

The company will request pre-authorization from the member for infertility services. Failing authorization, the company accepts payment at point of care with a credit card which is kept on file for future billing of services.

**ALCOR Life Extension Foundation**, which identifies itself as the "world leader in cryonics, cryonics research and cryonics technology," is located in Scottsdale, AZ. Membership includes life insurance for candidates in good health and eligibility, which will pay for cryopreservation of the whole body.

A growing number of cryopreservation advocacy groups have sprung up to assist individuals with concerns, and a list of worldwide resources is appended (Appendix A).

Member concerns regarding cryopreservation maintenance after insurance benefit is terminated or exhausted may be offered these support groups as a resource for their needs.

Arbor Health Plan members may also find the clinical trials ongoing in regards to onco-infertility to be of benefit.

**Summary of clinical evidence:**

**Glossary**

**Cryopreservation** — A process in which sperm and embryos are frozen in liquid nitrogen and may be thawed for future use.

**Gonad** — A reproductive cell-producing gland, such as an ovary.

**Gonadotoxic** — Having a deleterious effect on the gonads, such as chemotherapy or radiation therapy.

**Onco-infertility** — The growing field of cancer-related infertility.

**Professional society guidelines/others:**

**Peer-reviewed references:**

**Clinical trials:**

Six studies were located that address cryopreservation to preserve fertility in adult cancer survivors.

Last accessed 4 June 2015.

- NCT01558544: Cryopreservation of Ovarian Tissue. (This study is currently recruiting participants.)
- NCT00839839: Egg Freezing Pilot Study. (This study has been completed.)
• NCT01268592: Fertility Preservation in Female Cancer Patients. (This study has been terminated. Study technique has been declared part of standard care.)

• NCT00578500: Fertility Preservation by Ovarian and Oocyte Cryopreservation (HFPP). (The recruitment status of this study is unknown because the information has not been verified recently.)

• NCT02225145: Fertility Preservation in Women Who Will Have Gonadotoxic Therapy or Hematopoetic Stem Cell Transplantation, and in Women With Sickle Cell Disease. (This study is currently recruiting participants.)

• NCT00902720: Ovarian Tissue Freezing For Fertility Preservation. (This study is currently recruiting participants.)

CMS National Coverage Determinations (NCDs):

No NCDs specifically for cryopreservation to preserve fertility in adult cancer survivors were identified on the CMS website. However, Medicare does cover reasonable and necessary services associated with treatment for infertility:

Local Coverage Determinations (LCDs):

There are LCDs which address specific infertility services that are not covered. See the LCDs for Noncovered Services. (https://www.noridianmedicare.com/cgi-bin/coranto/viewnews.cgi?id=EFAFFVFVkptPNwMfaJ&tmpl=part_b_viewnews&style=part_ab_viewnews) accessed July 24, 2015

Commonly Submitted Codes

Below are the most commonly submitted codes for the service(s)/item(s) subject to this policy. This is not an exhaustive list of codes. Providers are expected to consult the appropriate coding manuals and bill in accordance with those manuals.

Appendix A

Worldwide cryonics support groups:

- **Australia**: The Cryonics Association of Australasia offers support for Australians or residents of other nearby countries seeking information about cryonics. caalist@prix.pricom.com.au. Their public relations officer is Philip Rhoades. phil@pricom.com.au. GPO Box 3411 NSW 2001 Australia. Phone: +61 2 8001 6204 (office) or +61 2 9922 6979 (home).
- **Belgium**: A new website in Dutch and French is being set up for Belgian cryonicists. [http://users.skynet.be/cryonicsbelgium/](http://users.skynet.be/cryonicsbelgium/). Contact David Verbeke at david.verbeke@scarlet.be or cryonicsbelg@hotmail.com for further information.
- **Canada**: This is a very active group that recently participated in Toronto's first cryopreservation. President, Christine Gaspar, Vice President, Gary Tripp. Visit them at: [http://www.cryocdn.org/](http://www.cryocdn.org/). There is a subgroup called the Toronto Local Group. Meeting dates and other conversations are held via the Yahoo group. This is a closed group. To join write:csc3@cryocdn.org.
- **Denmark**: A Danish support group is online. Contact them at: david.stodolsky@socialinformatics.org.
• **Finland**: The Finnish Cryonics Society, (KRYOFIN) is a new organization that will be working closely with KrioRus. They would like to hear from fellow cryonicists. Contact them [here](#). Their President is Antti Peltonen.

• **France**: Roland Missionnier has formed SOCIETE CRYONICS de FRANCE. He would like to hear from cryonicists in Switzerland, Luxembourg and Monte Carlo. CELL: (0033) 6 64 90 98 41, FAX: (0033) 4 77 46 96 12 or rolandmissonnier@yahoo.fr.

• **Germany**: There are a number of cryonicists in Germany. Their homepage is: [www.biostase.de](http://www.biostase.de). (English version in preparation.) If there are further questions, contact Prof. Klaus Sames at sames@uke.uni-hamburg.de.

• **Greece**: Greek Cryonics Support Group. Sotiris Dedeloudis is the Administrator. Find them at: [http://www.cryonics.gr/](http://www.cryonics.gr/).

• **Ireland**: Cryonics Ireland is a new subgroup of Cryonics UK and is for people in Ireland who are signed up, in the process of signing up, or just interested in Cryonics. They have an Irish-specific website: [www.cryonics.ie](http://www.cryonics.ie). Mark Walker can be contacted at: mark@cryonics.ie.

• **Italy**: Giovanni Ranzo and Aldo Fusciardi are located in the Rome area. Giovanni.r@operamail.com. The Italian Cryonics Association (Associazione Italiana Cryonica –AIC), The Life Extension Research Group (Gruppo di per l’Estension della Vita — GREV). [www.i-lifegroup.org](http://www.i-lifegroup.org). The founder is Bruno Lenzi; contact him at: mr.brown88@hotmail or 348.83.97.613.

• **Japan**: Hikaru Midorikawa, is President of the Japan Cryonics Association, formed in 1998. Their goals are to disseminate cryonics information in Japan, to provide cryonics services in Japan and, eventually, to allow cryonics to take root in Japanese society. mid_hikaru@yahoo.co.jp or [http://www.cryonics.jp/index-e.html](http://www.cryonics.jp/index-e.html).

• **New Zealand**: Contact Cam Christie, easternhk@hotmail.com, or go to: [http://www.nzcryonicssociety.org.nz/](http://www.nzcryonicssociety.org.nz/).

• **Netherlands**: The Dutch Cryonics Organization is the local standby group and welcomes new enthusiasts ([http://www.cryonisme.nl](http://www.cryonisme.nl)). Contact Secretary Jappie Hoekstra at +31-(0)6-53213893 or email: jh@hoekstra-media.nl.

• **Portugal**: Nuno & Diogo Martins with Rui Freitas have formed a group to aid Alcor members in Portugal. Contact: n-martins@n-martins.com, [www.cryonics.com.pt/](http://www.cryonics.com.pt/).

• **Russia**: KrioRus is a new Russian cryonics organization operating in Russia, CIS and Eastern Europe that exists to help arrange cryopreservation and long-term suspension locally, or with CI or Alcor. Please contact krirus@mail.ru or danila.medvedev@mail.ru for additional information, or visit [http://www.krirus.ru](http://www.krirus.ru). Phone: 7-905-768-04-57 or +7 (495) 489-52-60.

• **Spain**: Giulio Prisco is Secretary of the Spanish Cryonics Society. http://www.cronica.org.sec. He lives in Madrid and he’s a life member of CI. He is willing to serve as a contact point for Europeans. He can be contacted at (34)610 536144 or giulio@gmail.com.

• **United Kingdom**: The UK has largest number of cryonicists outside the United States. [www.cryonics-europe.org](http://www.cryonics-europe.org) is an informative site run by former CI Director John de Rivaz (John@deRivaz.com). Also, a joint CI & Alcor support group known as “Cryonics UK” or “CUK” can be investigated at [www.cryonics.uk.com](http://www.cryonics.uk.com). Secretary, Mark Walker-mark@maka.comCI. For signup help, contact David Flude, david.flude114@googlemail.com.
